

ZIMBRA-TO-ZIMBRA MIGRATION SOFTWARE

Any version 8.8.15 or higher. Any OS. Any Zimbra edition.

All Easily Migrated — with the source left intact.

When a Rolling Upgrade or a system-to-system rsync just won't do, our bespoke migration software moves a complete Zimbra system onto fresh infrastructure — recreating every account, user settings, and mailbox on the destination, all while the original system stays fully intact as your fallback.

PLATFORM-INDEPENDENT

FOSS ↔ Network Edition,
any Operating System

RE-ARCHITECT FREELY

Change server count &
topology

BATTLE-TESTED

Refined on real customer
cutovers

ZERO-RISK SOURCE

Original system left
untouched

BUILT FOR THE MIGRATIONS THAT MATTER

Reach for our migration software when:

- 01 A Rolling Upgrade or an rsync migration isn't appropriate, for example when S3 is present on the source system.
- 02 You bought a Network Edition license and need to migrate off an existing Open Source system.
- 03 You're a Zimbra BSP partner onboarding a new customer's to-be-retired self-hosted Zimbra system.
- 04 You need as short a cutover window as possible.

// EXAMPLE MIGRATION

SOURCE

Zimbra 9.0.0
FOSS
Ubuntu 18

DESTINATION

Zimbra 10.1 NE
Rocky Linux 9

Different versions, different OS,
FOSS → Network Edition — and a different number of
servers in the same move. Our software does that.

HOW IT WORKS — A TWO-PATH ARCHITECTURE

Provisioning recreates the full system — users, structure, and settings — while IMAPSYNC moves every message in parallel. The source is read, never altered, so you always have a clean rollback.

Certified across the Zimbra spectrum

SALES · ENGINEERING · ADMIN · GOLD VAR · SILVER BSP · INSTRUCTOR

A whole Zimbra system... recreated — not approximated.

Developed over many months of continuous refinement across real customer migrations. Our software, working with IMAPSYNC, migrates a complete system and leaves the source intact — just in case.

INFRASTRUCTURE

- **Classes of Service** with the full inheritance chain preserved. A name that already exists is restored as <name>_restored rather than overwriting, and affected domains/accounts are reprinted.
- **Local domains & domain aliases**, plus each domain's default COS.
- **Per-domain DKIM keys** — signed mail keeps verifying at cutover with no DNS change.
- **Distribution lists**, their members, and DL aliases.
- **Resource accounts** (e.g. conference rooms).
- **External / virtual accounts** — off-domain users shared into internal folders or resources.

USER ACCOUNTS

- Password, display / given / surname
- Email aliases; preferred From address & display name
- Work title & company
- Full address, ZIP, and telephone
- Explicit per-account COS assignment
- All account-level ACEs and the zimbraId
- All Sieve scripts (filters)
- Personal Amavis block / allow lists & Trusted Senders
- Spell-check "words to ignore"

MAILBOX CONTENT

- **All address books** — every contact folder and subfolder, not just /Contacts, each exported individually with names preserved.
- **All calendars** — every calendar folder and subfolder, not just /Calendar.
- **Briefcase and Tasks.**
- **Email signatures.**
- **Folder shares** — outgoing grants and incoming mountpoints, recreated in the correct dependency order.

ALL MAIL

Every share respected; every message copied by IMAPSYNC.

Folder sharing is handled accurately. IMAPSYNC migration scripts are created automatically with per-account folder exclusion lists. Folders User A shares to User B are only sync'd on User B's mailbox. User A sees those folders' contents when sharing is restored at the tail end of the migration.

What does not migrate // BY DESIGN

- **GALsync accounts.**
- **MFA / 2FA, ActiveSync, S/MIME, ZCO/EWS, NE Backup** — skipped automatically on a Network Edition → FOSS move; they have no FOSS equivalent and would fail account creation.
- **Custom localconfig, MTA settings, SSL certs, branding, external auth** (Okta / JumpCloud / AD) — these belong to the destination's own build.
- **Domain-level ACEs** — account-level ACEs do migrate.
- **Admin-role flags** (zimbraIsAdminAccount / delegated) — intentionally not set; admins are exported for reference and reconstructed deliberately.
- **Per-domain public-service hostname / port / protocol** — you set these on the destination, since they often change as a result of a migration.

LICENSING

\$495

per migration

\$7.85

per mailbox migrated

Volume discounts available above 2,500 mailboxes.

Schedule a migration.
